

---

# MSDS420

Atef Bader, PhD

# Agenda

---

- Syllabus
- Canvas - Course Homepage
- FAQ
- Course Topics - Walkthrough
- Technologies and Tools: Python, SQLite, Anaconda, PostgreSQL (SQL) and ElasticSearch (NoSQL)

# FAQ

---

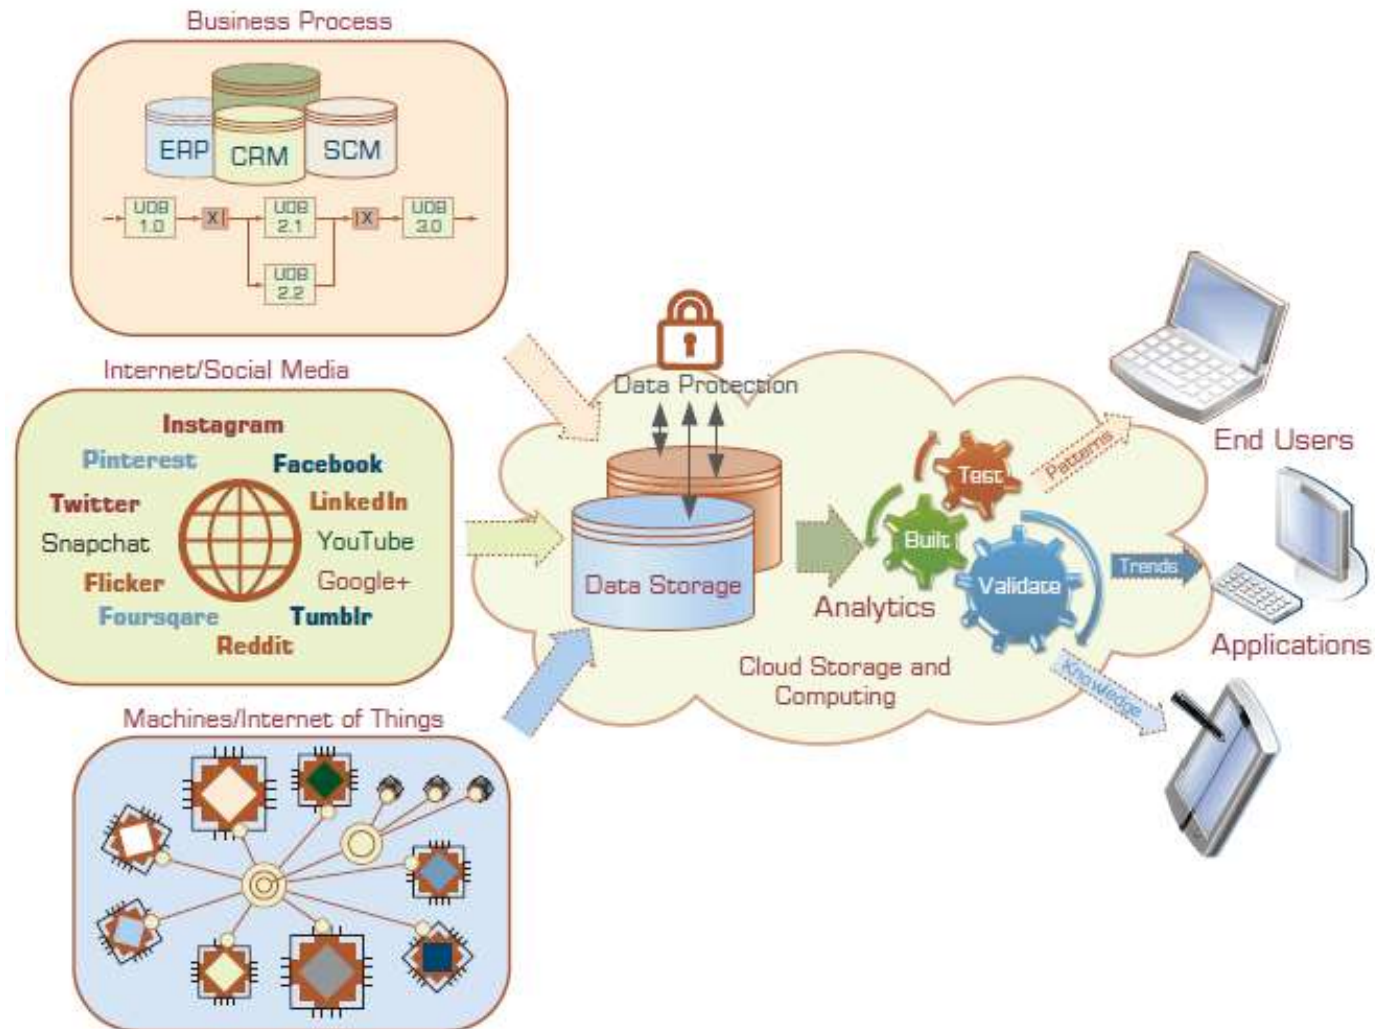

- What is this class about?
  - Explore the fundamentals of data management and data preparation
  - Structured data vs. Unstructured data
  - Relational Database & File Processing
  - Python, SQL/NoSQL
  - Database Engines: SQLite, PostgreSQL, ElasticSearch
- Do I need programming background?
  - Yes, if you programmed in Python, R, Java, JavaScript, C, or C# before, you can manage in this class
  - If you didn't program before in any high-level programming language, drop the class, and take MSDS430 (Python for Data Science) first.
- Where can I find the due dates for assignments?
  - Canvas/Syllabus

# The Nature of Data

---

- Data: a collection of facts
  - usually obtained as the result of experiences, observations, or experiments
- Data may consist of numbers, words, images, ...
- Data is the lowest level of abstraction (from which information and knowledge are derived)
- Data is the source for information and knowledge
- Data quality and data integrity → critical to analytics

# The Nature of Data

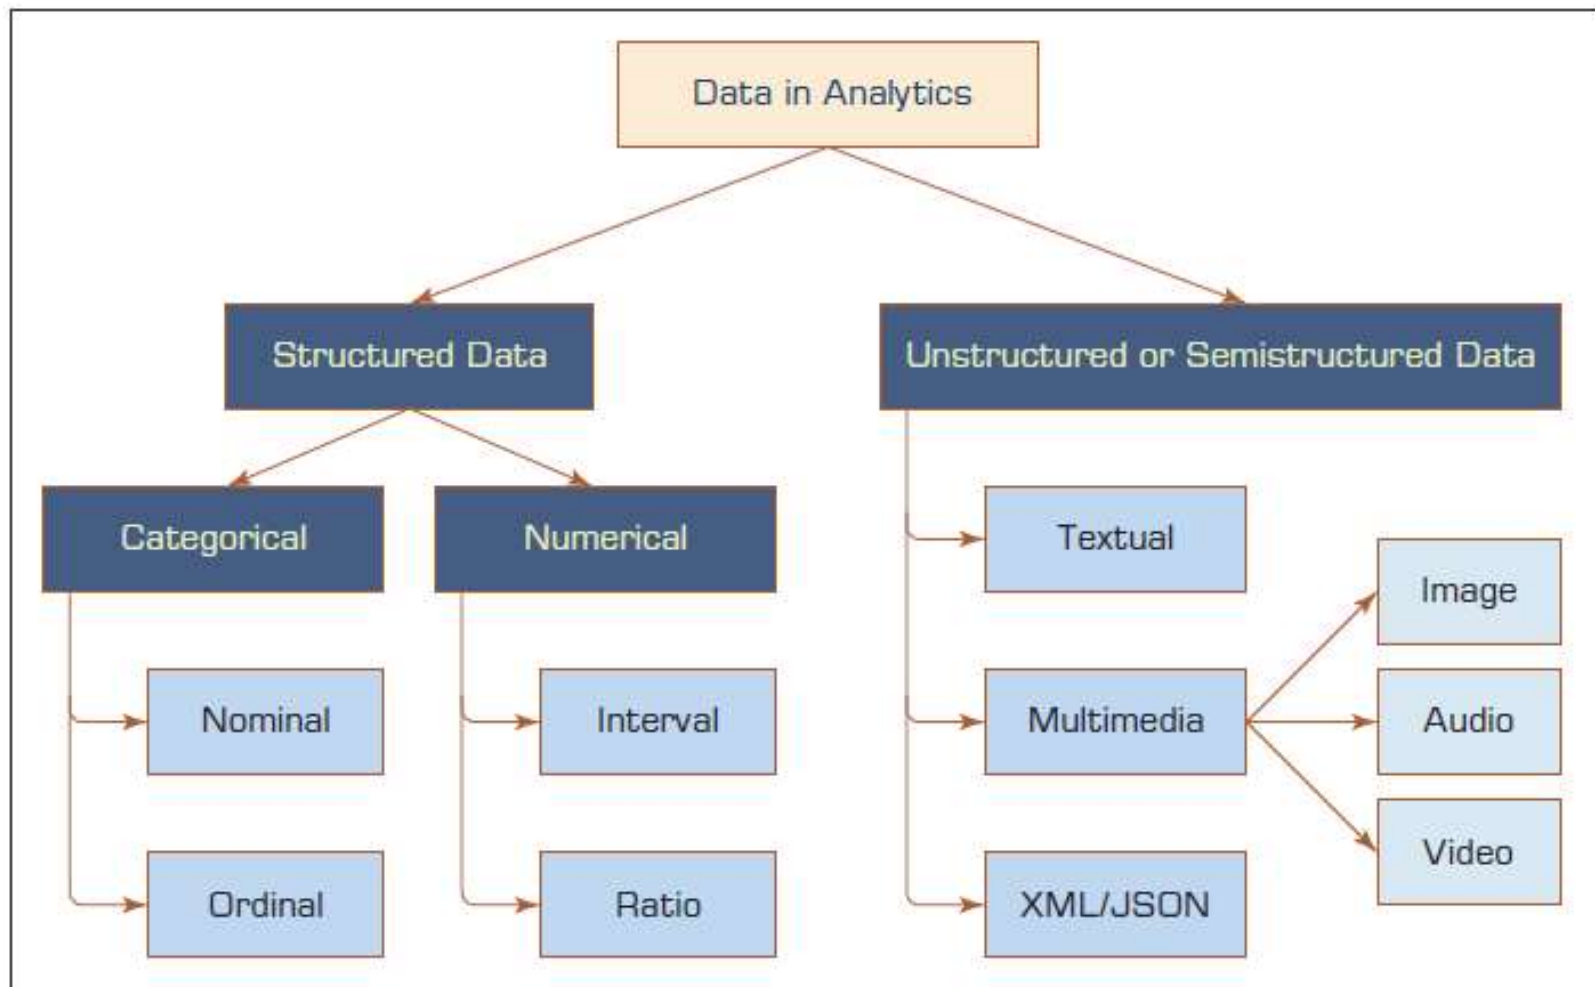

# A Simple Taxonomy of Data

---

- Data (datum—singular form of data): facts
- Structured data
  - Targeted for computers to process
  - Numeric versus nominal
- Unstructured/textual data
  - Targeted for humans to process/digest
- Semi-structured data?
  - XML, HTML, Log files, etc.
- Data taxonomy...

# A Simple Taxonomy of Data

---

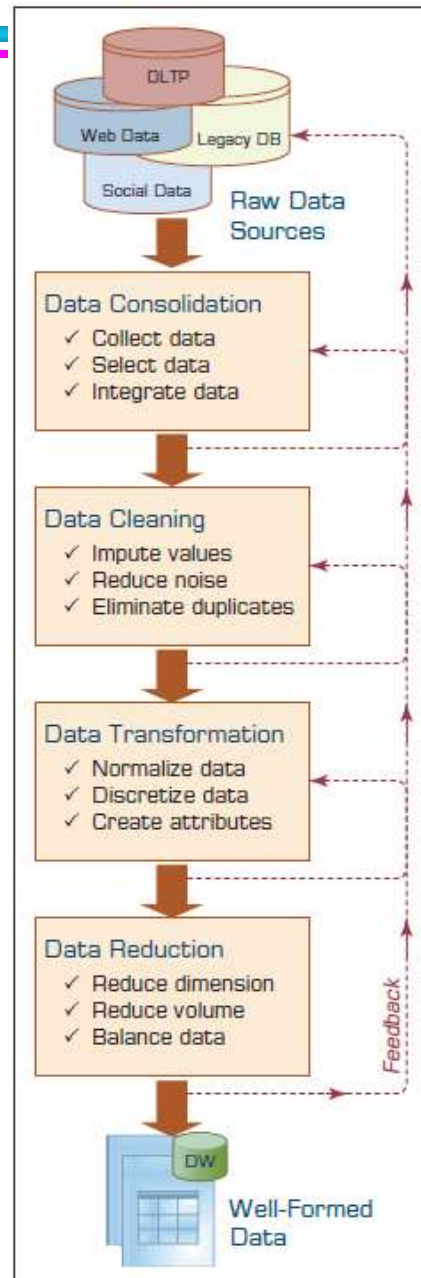

# The Art and Science of Data Preprocessing

---

- The real-world data is dirty, misaligned, overly complex, and inaccurate
  - Not ready for analytics!
- Readyng the data for analytics is needed
  - Data preprocessing
    - ◆ Data consolidation
    - ◆ Data cleaning
    - ◆ Data transformation
    - ◆ Data reduction
- Art – it develops and improves with experience

# The Art and Science of Data Preprocessing

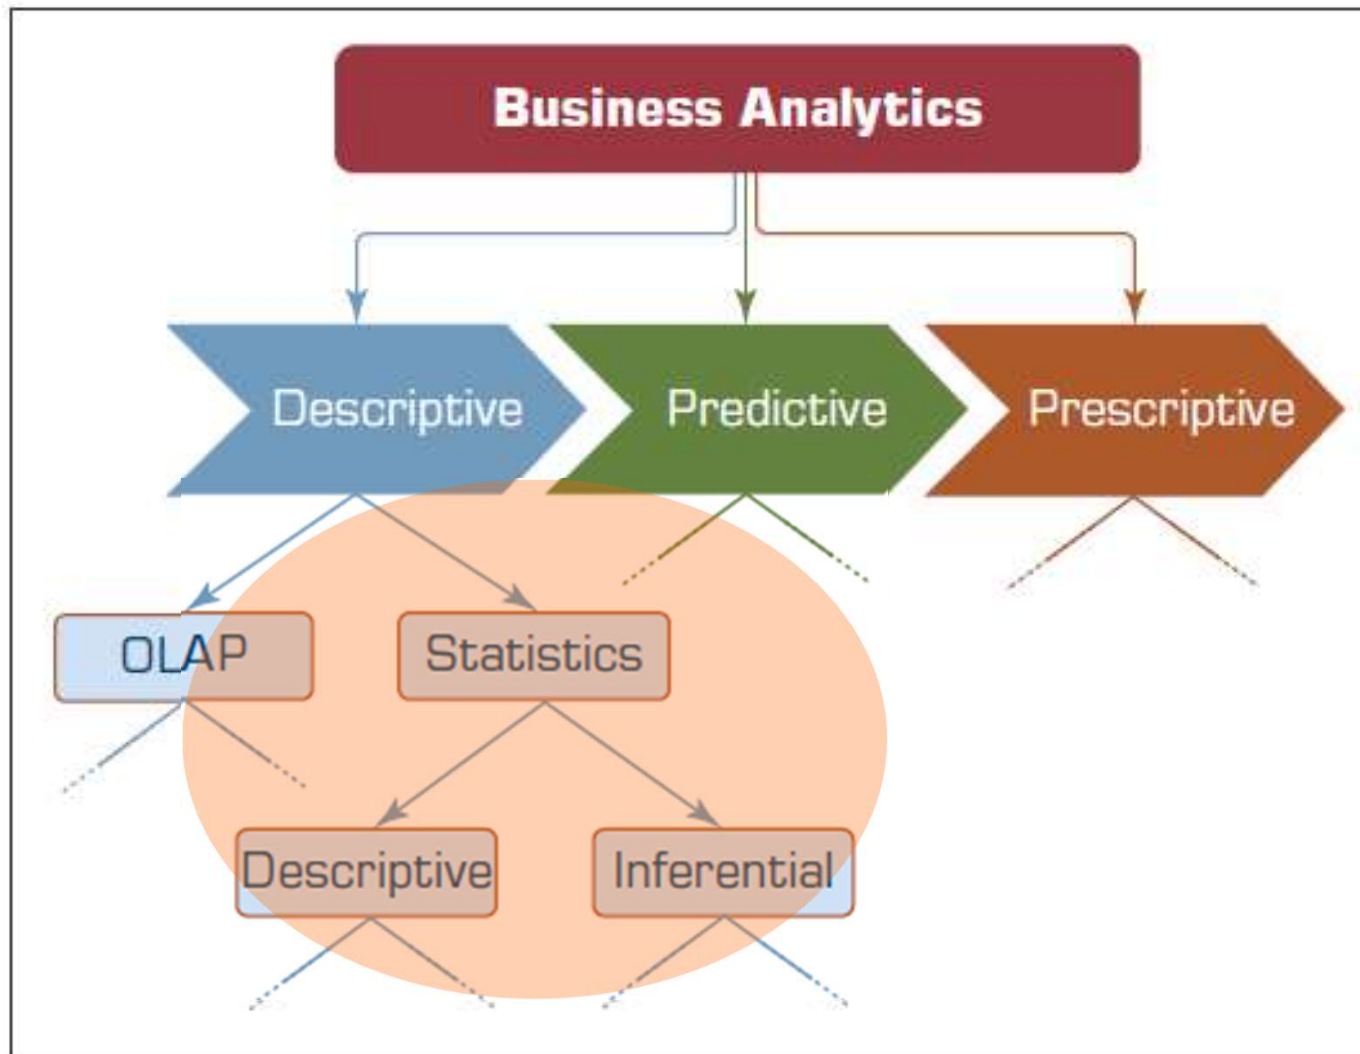

# Data Preprocessing Tasks and Methods

**TABLE 2.1 A Summary of Data Preprocessing Tasks and Potential Methods**

Main Task	Subtasks	Popular Methods
Data consolidation	Access and collect the data	SQL queries, software agents, Web services.
	Select and filter the data	Domain expertise, SQL queries, statistical tests.
	Integrate and unify the data	SQL queries, domain expertise, ontology-driven data mapping.
Data cleaning	Handle missing values in the data	Fill in missing values (imputations) with most appropriate values (mean, median, min/max, mode, etc.); recode the missing values with a constant such as "ML"; remove the record of the missing value; do nothing.
	Identify and reduce noise in the data	Identify the outliers in data with simple statistical techniques (such as averages and standard deviations) or with cluster analysis; once identified, either remove the outliers or smooth them by using binning, regression, or simple averages.
	Find and eliminate erroneous data	Identify the erroneous values in data (other than outliers), such as odd values, inconsistent class labels, odd distributions; once identified, use domain expertise to correct the values or remove the records holding the erroneous values.
Data transformation	Normalize the data	Reduce the range of values in each numerically valued variable to a standard range (e.g., 0 to 1 or -1 to +1) by using a variety of normalization or scaling techniques.
	Discretize or aggregate the data	If needed, convert the numeric variables into discrete representations using range- or frequency-based binning techniques; for categorical variables, reduce the number of values by applying proper concept hierarchies.
	Construct new attributes	Derive new and more informative variables from the existing ones using a wide range of mathematical functions (as simple as addition and multiplication or as complex as a hybrid combination of log transformations).
Data reduction	Reduce number of attributes	Principal component analysis, independent component analysis, chi-square testing, correlation analysis, and decision tree induction.
	Reduce number of records	Random sampling, stratified sampling, expert-knowledge-driven purposeful sampling.
	Balance skewed data	Oversample the less represented or undersample the more represented classes.

# Statistical Modeling for Business Analytics

---

# Data

- Data need to be processed
  1. Structured
    - Employee record, Product, Order, Transaction, etc.
  2. Unstructured/Semistructured
    - Email, Tweets, blogs, social chats, reviews, etc.

# Database Management System

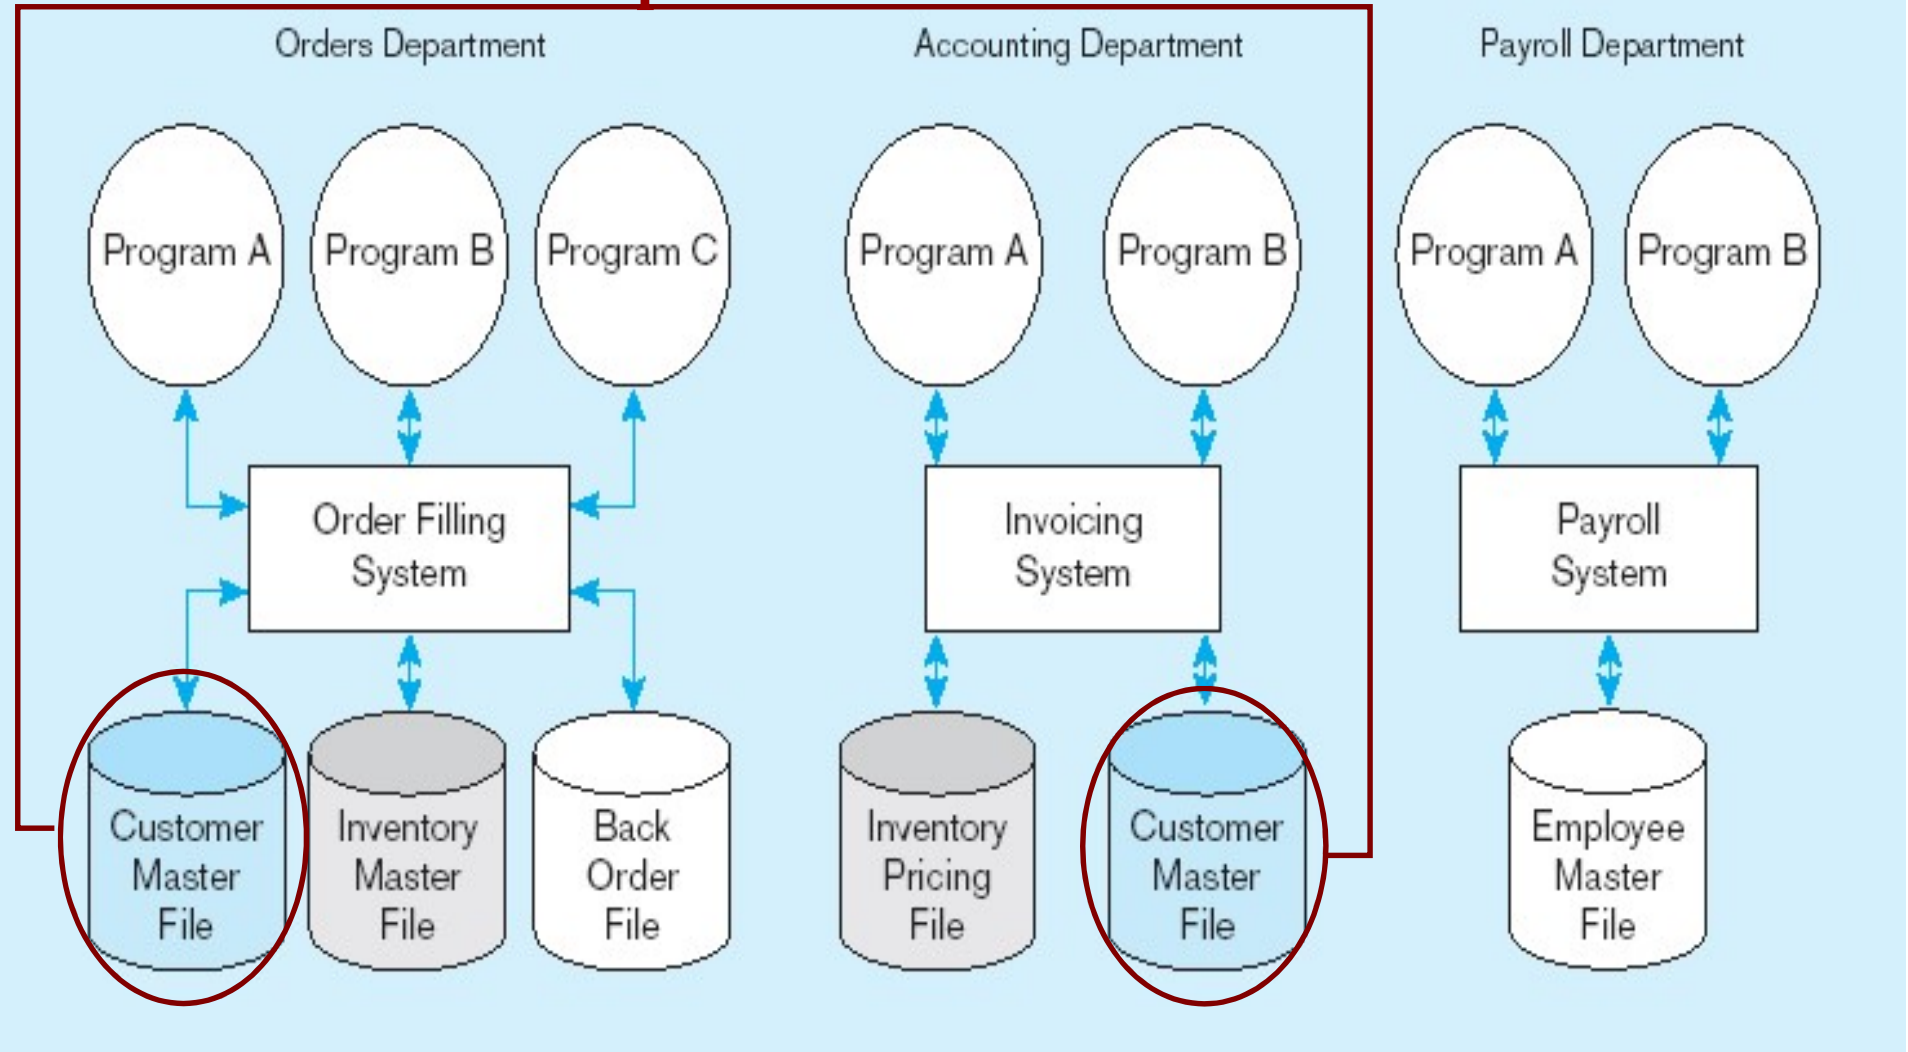

A software system that is used to create, maintain, and provide controlled access to user databases

***DBMS manages data resources like an operating system manages hardware resources***

# File Processing Systems

## Duplicate Data

# Disadvantages of File Processing

---

## ❑ Program-Data Dependence

- All programs maintain metadata for each file they use

## ❑ Duplication of Data

- Different systems/programs have separate copies of the same data

## ❑ Limited Data Sharing

- No centralized control of data

## ❑ Lengthy Development Times

- Programmers must design their own file formats

## ❑ Excessive Program Maintenance

- 80% of information systems budget

# Advantages of the Database Approach

---

- Program-data independence
- Planned data redundancy
- Improved data consistency
- Improved data sharing
- Increased application development productivity
- Enforcement of standards
- Improved data quality
- Improved data accessibility and responsiveness
- Reduced program maintenance
- Improved decision support

# Old School for Data vs New School for Data

---

## □ The Old School for Data

- Unstructured Data (Megabytes/Gigabytes)
- Structured Data → Relations (Tables)
- File Processing → RDBMS

## □ The New School for Data

- Social Media, Mobile computing, Cloud computing and the internet produce Exabytes of primarily Unstructured Data on a daily basis
- Unstructured data has many potentially useful patterns (the case for Big Data Analytics)
- Structured Data still in use
- File Processing pushed back to front seat
- RDBMS still in use

# Specialization/generalization of Staff entity into job roles and contracts of employment

# Data , what is in the name?

---

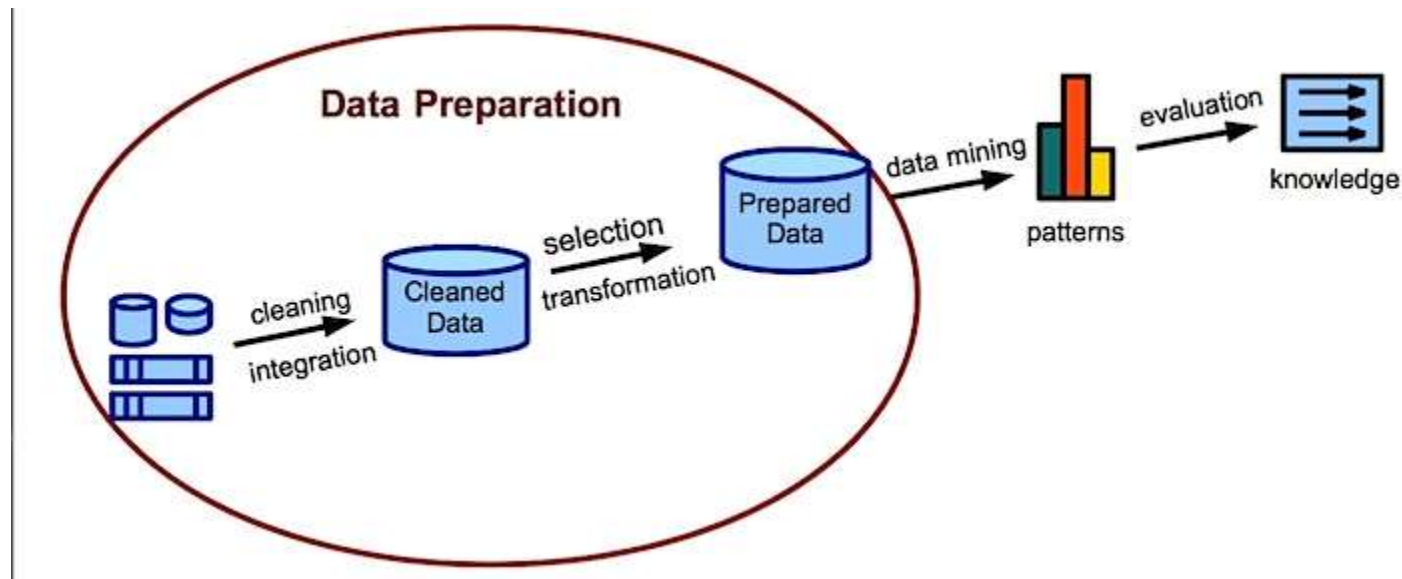

- Different terms used and interpreted differently:
  1. Data Preparation/Preprocessing
  2. Data Analysis
  3. Data Analytics
  4. Data Mining
  5. Data Processing
  
- Lets review each one of these terms ...

# Data , what is in the name?

## 1. Data Preparation/Preprocessing

- Data preparation (or data preprocessing) in this context means manipulation of data into a form suitable for further analysis and processing.

# Data , what is in the name?

---

## 2. Data Analysis

- Analysis proceeds design
- We say we do analysis to discover basic elements, relationships between the elements, and operations on the elements
- How we do analysis to design and build a database system for example?
- For example,
  - a company has employees, and offices
  - Company has name and budget
  - Office has number and address
  - Employee has an ID, name, salary
  - We want to be able to get a list of employees
  - We want to get a list of offices assigned to employees

# Data , what is in the name?

---

## 3. Data Analytics

- Is the science of examining raw data with the purpose of drawing conclusions about that information.
- Data Analytics use statistics, data mining, computer technology, etc to draw an inference
- Data analytics focuses on inference, the process of deriving a conclusion based solely on what is already known
- The term "analytics" has been used by many business intelligence (BI) software vendors as a buzzword to describe quite different functions
- Banks and credit cards companies, for instance, analyze withdrawal and spending patterns to prevent fraud or identity theft. Ecommerce companies examine Web site traffic or navigation patterns to determine which customers are more or less likely to buy a product or service based upon prior purchases or viewing trends

# Data , what is in the name?

---

## 4. Data Mining

- Is about sorting through large **data sets** using **software tools** and **Machine Learning algorithms** to identify **useful patterns** , **hidden knowledge** , and **hidden relationships**.

# Data , what is in the name?

---

## 5. Data Processing

- Apply Operations on data. (Addition, Multiplication, String tokenizer, etc.)

# Big Data - Prime Time

## “Big Data” is Growing

- 383+ Million Twitter accounts

- 835+ Million Facebook subscribers

- 1.2+ Billion Mobile Web users

- Machine and sensor data

- Over 6 million OnStar subscribers

This data as of 2012

# Big Data - Prime Time

---

- People spend over 500 billion minutes per month on Facebook.
- YouTube receives more than 2 billion viewers per day
- More than 30 billion pieces of content are shared each month on Facebook.
- Every minute, 24 hours of video is uploaded to YouTube
- As of December 2010, the average number of tweets sent per day was 110 million

# Big Data Prime Time

---

How much data you think roughly out there ?

- How much data on your laptop?
- How much data on your PDA?
- How much data on your personal gmail account?
- How much data on facebook?
- How much data on twitter?
- etc. ...

Decimal		
Value	Metric	
1000	kB	kilobyte
$1000^2$	MB	megabyte
$1000^3$	GB	gigabyte
$1000^4$	TB	terabyte
$1000^5$	PB	petabyte
$1000^6$	EB	exabyte
$1000^7$	ZB	zettabyte
$1000^8$	YB	yottabyte

1 EB = 1000000000000000000B =  $10^{18}$ bytes = 1000 petabytes = 1 billion gigabytes.

The **Apollo Guidance Computer (AGC)** was a [digital computer](#) produced for the [Apollo program](#) that was installed on board each Apollo [Command Module \(CM\)](#) and [Lunar Module \(LM\)](#). The AGC provided computation and electronic interfaces for guidance, navigation, and control of the spacecraft.<sup>[2]</sup> The AGC had a 16-bit [word](#) length, with 15 data bits and one [parity bit](#). Most of the software on the AGC was stored in a special [read only memory](#) known as [core rope memory](#), fashioned by weaving wires through [magnetic cores](#), though a small amount of read-write [core memory](#) was provided.

AGC using a numeric display, keyboard, and its DSKY user interface for the Apollo program by the AGC is notable for being one of the first [integrated circuit-based](#) computers.

# Data Format

---

- Data is represented by ASCII code (American Standard Code for Information Interchange) which is the most widely used format.
- Data stored in Files as:
  1. Plaintext. Data is separated by comma, tab or space (plaintext). The most common extension is \*.csv (comma-separated value).
  2. Binary. Data is structured as a record by fixed blocks (formatted text)

## ISO 9075

From Wikipedia, the free encyclopedia

**ISO/IEC 9075 standard**: "Information technology - Database languages - SQL". See details by release:

- SQL:1999 is the *ISO/IEC 9075:1999* standard of 1999.
- SQL:2003 is the *ISO/IEC 9075:2003* standard of 2003.
- SQL:2006 is the *ISO/IEC 9075:2006* standard of 2006.
- SQL:2008 is the *ISO/IEC 9075:2008* standard of 2008.
- SQL:2011 is the *ISO/IEC 9075:2011* standard of 2011.

### Welcome.

SQLite is a software library that implements a [self-contained](#), [serverless](#), [zero-configuration](#), [transactional](#) SQL database engine. SQLite is the [most widely deployed](#) SQL database engine in the world. The source code for SQLite is in the [public domain](#).

### Sponsors

Ongoing development and maintenance of SQLite is sponsored in part by [SQLite Consortium](#) members, including:

[Bentley](#) - Comprehensive software solutions for Sustaining Infrastructure.

[Mozilla](#) - Working to preserve choice and innovation on the internet.

[Bloomberg](#) - A world leader in financial-information technology.

### Current Status

- [Version 3.8.8.3](#) of SQLite is recommended for all new development. Upgrading from version 3.8.8, 3.8.8.1, and 3.8.8.2 is optional. Upgrading from all other versions of SQLite is recommended.

# PostgreSQL

The screenshot shows the PostgreSQL website homepage. At the top is a blue header with the PostgreSQL logo and the tagline "The world's most advanced open source database." Below this is a navigation bar with links: Home, About, Download, Documentation, Community, Developers, and Support. The main content area features a large announcement for PostgreSQL 9.4.4, 9.3.9, 9.2.13, 9.1.18, and 9.0.22, dated June 12, 2015. The announcement text states that the PostgreSQL Global Development Group is pleased to announce the availability of these releases, which contain bug fixes over previous versions. It encourages users to upgrade their systems as soon as possible. Below the announcement are links for "Release Announcement" and "Download". To the right of the announcement is a section for "LATEST RELEASES" listing the same versions with links to "Notes" and "Download". Below this is a "SHORTCUTS" section with links to Security, International Sites, Mailing Lists, Wiki, Report a Bug, and FAQs. At the bottom left is a "FEATURED USER" section featuring Pascal Bouchareine from Gandi.net, who mentions using PostgreSQL for the Gandi IAAS/PAAS platform. At the bottom right is a "SUPPORT US" section stating that PostgreSQL is free and asking for support through donations.

# ElasticSearch

The image is a screenshot of a web browser displaying the ElasticSearch product page. The browser's address bar shows the URL <https://www.elastic.co/products/elasticsearch>. The page features the Elastic logo and navigation links for Products, Cloud, Services, Customers, and Learn. On the right side of the header, there are links for 'downloads', 'contact', a search icon, and a language selector set to 'EN'. Below the header, the word 'Elasticsearch' is displayed on the left, and 'Download' and 'As A Service' buttons are on the right. The main content area has a large circular logo with a stylized 'E' in the center. Below the logo, the heading 'The Heart of the Elastic Stack' is followed by a paragraph: 'Elasticsearch is a distributed, RESTful search and analytics engine capable of solving a growing number of use cases. As the heart of the Elastic Stack, it centrally stores your data so you can discover the expected and uncover the unexpected.' At the bottom of the page, there is a colorful illustration of a stylized robot or machine with blue and yellow components.

The Heart of the Elastic Stack

Elasticsearch is a distributed, RESTful search and analytics engine capable of solving a growing number of use cases. As the heart of the Elastic Stack, it centrally stores your data so you can discover the expected and uncover the unexpected.

# Bottom Line ...

---

## 1. What you will learn in this class?

- Learn the fundamental concepts for data management, data preparation, relational database, and file processing
- Database Engines
- Programming: Python and SQL/NoSQL

## 2. What you will do in this class?

- Weekly class discussions
- Assignments (covering different topics)
- Exercises (Python programming - data preparation/processing)
- Final Exam - Proctored through Examiity
